

## Plant sends alarming text

The SWI 300 remote plant monitoring system from 3wdata.com records voltage and temperature and can be programmed to send SMS text alerts if pre-determined levels are breached. Alarms can also be sent via email and a relay output can control users' applications.

The SWI 300 connects to 3wdata.com's database via the Internet, so it can receive its configuration, upload its data and send its alarms to anywhere in the world. The on-line wizard makes setting-up easy for non-technical users. Readings are displayed locally on the integral LCD and an audible alarm can alert local personnel. Data is displayed graphically on the website. The SWI 300 is supplied with an international power supply, one year's hosting and a thermocouple sensor.
